

## **Those Questioning Evolution shall be Burned at the Stake**

By Samuel J Alibrando author *Nature Never Stops Talking*

When facts fail, other strategies emerge. Like most Americans educated in public school, I was taught and easily believed evolution. At 52, I see huge SCIENTIFIC flaws in the general theory.

I am pleased with so many Americans questioning things taught by condescending experts that feel no need to prove their theories and criticize “amateurs” for questioning their expertise.

The Scopes trial, when religious bigots condemned the evolutionary theory for its anti-Bible implications, was a correct challenge because religious custom is no answer to scientific questions.

Today, the pendulum has swung the other way and now evolutionists dodge scientific questions. Instead, they are now accusing all challengers as being religiously motivated. What a funny switch. Just like creationists during the Scopes Monkey trial in 1925 dodged questions by pointing their finger and accusing scientists as being heathen. Today, evolutionists are dodging questions by pointing their finger and accusing all challengers as being religious. Again, not a scientific answer.

It is a comedy to watch. Intellectual types making sweeping statements about the evolutionary theory being well-accepted. “Well-accepted” is not a scientific answer.

If someone asks, “Since we have never witnessed a brand new species emerging from a different species, how do you justify claims that all species today emerged exactly that way?”

Response: “You religious fanatic. Get out of here with those religious questions.”

Huh? After the questioner is dragged out in handcuffs for trying to mix religion with science, the evolutionist assures the crowd, “About that question; we all know evolution is a well-accepted fundamental tenet of science. Shall we move along?”

I saw something like this in a Kansas City Star article [*Panel Speaks Out for Evolution* by Diane Carroll]. Frankly, I see the evolution group running scared. I see evolutionists intimidated by those who ask rational questions and making good sense with criticisms - downright scientific criticisms.

The evolutionists’ response is not a scientific answer but instead telling Americans to be loyal to customs and ban all challengers. We are back in 1925 except now it is the scientists that need to be challenged from their lofty place of condemning any who question them. The last thing they want is a battle of fact finding. The last thing they want is a genuine review of how unwarranted scientific credibility is for evolution. It has been more than 80 years since the Scopes trial. Many billions of dollars have been spent to research the theory. Where’s the beef?

They evolutionists officially boycott fact-finding meetings saying they don’t want to give scientific credibility to intelligent design theories. Ha. Maybe they can just make the public think anyone who challenges them is stupid and doesn’t deserve to be seriously considered. Yeah, that might work.

Krishtalka, a Kansas University scientist jumps out of his science circle and does the standard claim declaring they are all religious. It’s like these scientists all over the country are all reading off of the same 3X5 card. Leave it to that same scientist who prefers accusing people of being religious rather than make any actual scientific

statements to then say nature is not intelligently designed. How could a scientist claim nature is not intelligent? Well, according to Krishtalka, because men have nipples and there are some birds that can't fly – nature is unintelligent. Yeah, he really said that in the article.

The whole world admires the genius and marvel of nature and this guy says nature isn't intelligent.

Then take Joseph Heppert, director of the Kansas University Center for Science. Even though evolution continues receiving more and more challenges as seen by articles popping up throughout the U.S.; he makes the declaration "...evolution is not a controversial theory ...". Doesn't he know why he is being interviewed for national news coverage? By the way, I hear this exact same statement coming from scientists interviewed all over the country. Same 3X5 card?

Also amazing was the summary by the journalist who said that the "resounding theme was that a poor biology education in Kansas would translate into a poorly prepared work force for the bioscience industry."

I could hardly contain myself. I was smiling so big I felt silly. Here is a school board with national media coverage asking for scientific proof for the evolutionary theory versus alternate views and instead of putting concerns to rest with facts, these scientists boycott and call Intelligent Design a threat to biology education and a financial threat to Kansas???? Now everyone is getting suspicious of these guys. I hope some readers are laughing. I mean no disrespect but this seems a little overdramatic to me.

This article was outlined in drama. The opening had to do with college students thinking of moving out of Kansas so they can raise their families somewhere where intelligent design of nature is not considered.

How can I refrain from sarcasm? Crime, no problem. Bad air, who cares. High taxes, traffic safety, child molesters, divorce, violence on TV, unrestrained greed, dishonesty, war and terrorism, poisons in our food; these are concerns but if someone criticizes evolution with an intelligent design theory, we're moving out of Kansas!

I am totally serious. This is not from me. These are concerns expressed in the article as though a serious threat.

Who is moving the focus away from scientific facts? The scientists are. What is going on here?

Honestly, I think we all admire the ingenuity of nature and if the possibility that it was designed is even discussed in Kansas classrooms, taxpayers might evacuate the state?

Folks these are not rational arguments, let alone scientific.

I say to the evolutionists; don't bully with censorship and silly claims. Just let students listen, think and decide based on what they hear. Let them consider what is the most scientific credible. They are only theories – what are evolutionists so afraid of – students having a choice?
